1 Term and value syntax

```
termvar, x, y, d
                       Term-level variable
holevar, h
                       Hole
term value, v
                                                                                              Term value
                                                                                                 Ampar
                                        \langle v_1, \overline{v_2} \rangle_H
                                                                                                 Destination
                                       @h
                                       ()
                                                                                                 Unit
                                       Inl v
                                                                                                 Left variant for sum
                                       Inr v
                                                                                                 Right variant for sum
                                       (v_1, v_2)
                                                                                                 Product
                                                                                                 Exponential
                                                                                                 Linear function
                                        \lambda \mathbf{x} . t
extended value, \overline{v}
                                                                                              Pseudo-value that may contain holes
                                                                                                 Term value
                                       h
                                                                                                 Hole
                                       Inl⊽
                                                                                                 Left variant with val or hole
                                       Inr⊽
                                                                                                 Right variant with val or hole
                                        (\overline{\mathsf{v}_1}\,,\,\overline{\mathsf{v}_2})
                                                                                                 Product with val or hole
                                                                                                 Exponential with val or hole
                                                                                              Term
term, t, u
                                ::=
                                                                                                 Term value
                                                                                                 Variable
                                                                                                 Application

                                       t ⊲• u
                                                                                                 Fill destination with root of ampar u
```

2 Type system

```
type, A, B
                                                                                        Type
                                                                                            Unit
                                                    1
                                                                                            Sum
                                                    A_1 \oplus A_2
                                                     A_1 \otimes A_2
                                                                                            Product
                                                                                            Exponential
                                                     \textbf{A}_1 \rtimes \textbf{A}_2
                                                                                            Ampar type (consuming A_1 yields A_2)
                                                                                            Linear function
                                                                                            Destination
 multiplicity, m, n
                                                                                       Multiplicity (Semiring with product ·)
                                                                                            Born now. Identity of the product
                                                                                            One scope older
                                                                                            Infinitely old / static. Absorbing for product
                                                                                            Semiring product
                                                     m_1 \cdot m_2
                                                                                        Typing context
 typing_context, \Delta
                                                    Γ
                                                     \Gamma \mathrel{\sqcup} H
                                                     m \cdot \Delta
                                                                                            Increase age of bindings by m
 pos_context, \Gamma
                                                                                        Positive typing context
                                                     {pos_assign*}
                                                     \Gamma_1 \sqcup \Gamma_2
                                                     m \cdot \Gamma
                                                                                            Increase age of bindings by m
 pos assign
                                                                                        Positive type assignment
                                                    \mathbf{x}:_m \mathbf{A}
                                                                                            Variable
                                                     @\mathbf{h}:_{m}{}^{n}\!\!\mid\!\mathbf{A}\!\mid
                                                                                            Destination (m is its own age; n is the age of values it accepts)
 neg context, H
                                                                                       Negative typing context
